

PET/CT Rest/Stress Cardiac Perfusion Scan

What to expect

Read this handout to learn more about how a PET/CT rest/stress perfusion scan of the heart works, how to prepare for it, what to expect during the scan, and how to get your results.

What is a PET/CT rest/stress cardiac perfusion scan?

A *positron emission tomography/computed tomography* (PET/CT) rest/stress cardiac perfusion scan is a way to take pictures of blood flow to your heart muscle. Pictures will be taken when you are at rest and after a stress test.

This scan is a nuclear medicine exam. It uses a radioactive substance called a *tracer*. This scan is a form of radiology because radiation is used to take pictures of your body.

A PET/CT camera takes 2 types of pictures:

- The **PET scan** uses a radioactive tracer to show blood flow to your heart.
- The **CT scan** provides pictures of your heart and chest structures.

Together, the PET and CT scan will provide the images your healthcare provider needs to fully evaluate blood flow to your heart.

A nuclear medicine doctor will review your scan and send the results to your healthcare provider who referred you for the scan.

Why do I need this type of scan?

Used with other studies, this scan will show whether your heart muscle is receiving enough blood. This will help your healthcare provider assess your level of coronary artery disease.

How should I prepare?

- Some medicines can affect your test results. Ask your healthcare provider if you should stop taking any medicines before the exam.

Here are some medicines you may need to stop taking on the day of your exam:

- **Nitrates:** sublingual Imdur, Isomo, Isordil, Isosorbide, Nitrobid, NTG, and NTG patch
- **Beta blockers:** Atenolol, Carvedilol, Labetalol, Metoprolol, Nadalol, and Propanolol
- **Medicines that contain caffeine:** Midol, Excedrine, and others
- Call the Nuclear Medicine Department at 206.598.4240 if:
 - It is hard to place an *intravenous* (IV) line in your arm.
 - You cannot lie flat on your back for up to 30 minutes.

Before Your Scan

If You Weigh More Than 100 Pounds

- **12 hours** before your scan:
 - Do **not** eat or drink anything that contains caffeine. This includes coffee, chocolate, and medicines such as Midol or Excedrine.
 - Do **not** drink decaf products, coffee, tea (even herbal), cocoa, or any kind of soft drink.

If You Weigh Less Than 100 Pounds

- **24 hours** before your scan:
 - Do **not** eat or drink anything that contains caffeine. This includes coffee, chocolate, and medicines such as Midol or Excedrine.
 - Do **not** drink decaf products, coffee, tea (even herbal), cocoa, or any kind of soft drink.

For All Patients

- **For 6 hours** before your scan:
 - Do **not** eat or drink anything except water.
 - If you are scheduled for an afternoon appointment, you may have a very light breakfast **before 7 a.m.** on the day of your scan.
- **For at least 4 hours** before your scan:
 - Do **not** smoke cigarettes, marijuana, or cigars.
 - Do **not** use electronic cigarettes, vaping products, or any form of nicotine.
 - Do **not** drink alcohol or use any recreational drugs.
 - Do **not** chew tobacco.

Day of Your Scan

- Wear comfortable clothing and dress warmly. The room where you will be for the scan may be cold.
- Do not wear clothes with metal (such as zippers or snaps) or jewelry on the day of your scan.
- Make sure that your appointment time works well for you. The exact timing of this scan is very important, so please arrive on time. If you are more than 15 minutes late, your scan may need to be rescheduled.
- Plan to be in the Nuclear Medicine Department for about 1 to 1½ hours.

How is the scan done?

- When you arrive, a technologist will prepare you for your scan. An IV line will be placed in your arm. Small patches called *electrodes* will be attached to your chest. These will monitor your heartbeat during your *electrocardiogram* (ECG) test.
- You will be asked to sign a consent form that allows us to give you a stress test.
- You will be injected with a small amount of tracer through your IV. The tracer will travel through your veins and allow us to see pictures of your heart. It is very rare to have allergic reactions to this tracer.
- The PET/CT scanner will take pictures of your heart for 10 minutes. These images will show us the blood supply to your heart when you are at rest. After these images are taken, you will do the stress portion of the study.
- You will be given a medicine that increases blood flow to your heart. A nurse practitioner or doctor will monitor you during this time.
- After you receive this medicine, a second small dose of tracer will be injected through your IV. This allows us to take pictures of your heart when all of your blood vessels are fully relaxed. Taking these pictures will take another 10 minutes.

What will I feel during the study?

You may feel some discomfort during the stress study. The most common symptoms are feeling flushed, fullness in the chest or stomach, or shortness of breath.

A doctor or nurse practitioner will monitor you throughout the stress study. If needed, we may give you another medicine to help you feel better. You will be allowed to leave only when you are feeling better.

What happens after the study?

- You may resume your normal activities right after the study.
- The radioactivity from the tracer will be gone by the time you leave the department.

Who reads the scan and when will I get the results?

A nuclear medicine doctor and/or a nuclear cardiologist will read your PET/CT scan. This doctor will send your results within 3 days to your provider who referred you for this scan. Your own provider will talk with you about the results of your scan.

You may also read your results on your eCare Results page. If you need copies of your images on disc, call 206.598.6206.

You and your provider will decide the next step, such as treatment for a problem, as needed.

Questions?

Your questions are important. Call your doctor or healthcare provider if you have questions or concerns.
