MRI: Abdomen Scan
How to prepare and what to expect

This handout explains how an MRI scan of the abdomen works, how it is done, how to prepare for it, what to expect during the scan, and how to get your results.

What is MRI?

Magnetic resonance imaging (MRI) is a way to take pictures of your internal organs and tissues. It uses radio waves and a strong magnet to provide clear and detailed pictures. Even different types of tissue within the same organ can easily be seen in an MRI picture.

MRI will help your healthcare provider decide which treatment is best for your medical condition.

How does the scan work?

An MRI scan of the abdomen usually involves taking 4 or more sets of pictures. Each set lasts 14 seconds to 6 minutes and will show a different section of your abdomen.

For Your Safety

Health Review

We need to know about certain health conditions before giving you an MRI scan. Please tell us if you:

- Have any problems with your liver or kidneys
- Need a liver or kidney transplant
- Are on dialysis
- Have allergies to any drugs or contrast material
- Have had any surgeries
- Are pregnant or may be pregnant
Metal Review

We also need to know if you have any metal in or on your body before we give you an MRI scan. The strong MRI magnet will pull on any ferromagnetic object, such as iron and some other metals.

If you have any metal on or in your body, an MRI can harm you. Even small amounts that will not harm your body can distort the MRI picture.

Please tell MRI staff if you have:

• Aneurysm clips, a heart pacemaker (or artificial heart valve), an implanted port, an infusion catheter (with brand names such as Port-o-cath, Infusaport, or Lifeport), an intrauterine device (IUD), any metal plates, clips, pins, screws, or surgical staples, a prosthetic hip, or any implanted metal object in your body

Most times, surgical staples, clips, plates, pins, and screws are not a risk during MRI if they have been in place for more than 4 to 6 weeks. If there is any question of metal fragments, an X-ray may be done to check for them.

• Tattoos or permanent eyeliner
• Medicine patches
• A bullet or shrapnel in your body
• Ever worked with metal

Please also remove any other items that might contain metal and affect your MRI pictures. These include:

• Hairpins
• Jewelry
• Glasses, hearing aids, and any removable dental work

How do I prepare for the scan?

• If your scan is:
  - In the morning: Have a light dinner the evening before your scan. Do not eat breakfast on the morning of your scan.
  - In the afternoon: Have a light breakfast, such as an egg and toast, or cereal, on the morning of your scan. Do not eat lunch.

• Starting 4 hours before your scan time, do not eat any solid food.
• It is OK to drink liquids that do not contain caffeine, milk, or chocolate up to 1 hour before your scan.
How is the scan done?

- You will lie on a sliding table and a device called a surface coil will be placed around your abdomen.
- The MRI technologist will slide the table inside the MRI unit and then leave the room to take the MRI pictures.
- You will be able to talk with the technologist at any time through an intercom.
- We will ask you to hold very still as each picture is taken. We may also ask to hold your breath for some of the pictures.
- The scan usually takes 20 to 45 minutes.
- Sometimes, an injection of a contrast is used to make certain tissues or blood vessels easier to see. If you need this injection:
  - Your doctor will talk with you about it before your scan.
  - You will receive the injection about halfway through the scan.
  - It will be injected through a small needle and an intravenous (IV) line in your arm or hand vein.
  - If your doctor has asked for delayed enhancement images, we will need to take more images 20 minutes after your contrast injection. This will only add 5 to 10 minutes to the length of the scan.
- After the scan, you will be asked to wait until the pictures are checked for quality. More pictures will be taken, if needed.
- When your scan is over, the surface coil will be removed.

What will I feel during the scan?

- MRI does not cause pain.
- Some patients may feel confined or uneasy (claustrophobic) when they are inside the MRI unit. Please tell the doctor who referred you for the MRI if you are claustrophobic. You may receive medicine to help you relax.
- You may notice a warm feeling in the area where the pictures are taken. This is normal. If it bothers you, please tell the MRI technologist.
- You will hear loud tapping or knocking noises during the scan. We will provide earplugs and headphones with music to help block some of these sounds.
- If a contrast injection is needed, you may feel discomfort or coolness at the injection site.
Who interprets the results and how do I get them?

A radiologist skilled in MRI will review and interpret your MRI images. The radiologist will not talk with you about the results, but will send a report to your primary care or referring provider. This provider will give you the results. You and your provider will then decide the next step, such as treatment for a problem, as needed.

You may also read your results on your eCare Results page. If you need copies of your images on disc, call 206.598.6206.

Questions?

Your questions are important. Call your doctor or healthcare provider if you have questions or concerns.
